

Advantages at a glance:

- Automatic localisation, registering and deregistering
- Automatically update data after a disruption
- Revision-safe, automatic documentation of movement data
- EMC compliance
- Semi-real-time monitoring
- Integrates with overarching management system

Finding the location of individuals and objects onboard ships - whether civilian or military - is a task that presents particular challenges given the special environmental conditions such as large metal bodies, bulkheads, etc.

Individuals need to be located onboard ships in order to correlate the tasks and responsibilities associated with a particular position. This allows the captain to be certain at all times that the right person is in the right place to identify the relevant task, or whether someone else is there.

Comprehensive position information makes it possible to determine exact locations for medical or rescue personnel in case of an emergency, be it an accident in the civilian sector or an engagement on board a military vessel. This avoids wasting critical time at such an urgent juncture. The situation can also be compared before and after the incident in order to make the most rapid possible decisions about whether to seal off sectors or identify new crew structures.
