

Advantages at a glance:

- Automatic localisation
- Automatically check maintenance intervals
- Automatically update data following a disruption
- EMC compatibility
- Semi-real-time transfer
- Long-life position finding solution
- Personalised product design

“Field tracking” describes the ability to locate items such as goods and products within an open-air storage area or in a closed warehouse. Automated, ongoing position finding allows businesses to track and document all process steps on a per-item level.

Results are automatically assigned to objects thanks to automatic position checking and the system’s integration with specific testing steps or maintenance cycles. The result is automated, complete and revision-safe documentation for all items that move through this process. Field tracking also means that products subject to regular maintenance intervals can be stored in synchrony with these intervals, increasing efficiency.

Historical tracking enables automated documentation of the entire process as well as clear visibility of specific interim results while the process is still ongoing. This also minimises error rates and workloads for those involved in the process.

Field Tracking

Another advantage is that the position finding solution can be integrated into the security plan to deter theft. If a located product leaves the monitored area, a security alert is transmitted to the overarching monitoring system. Suitable measures can then be quickly implemented.
